

Debugging

The different debugging technics also in the cloud

- [Debugging RESTful API](#)

Debugging RESTful API

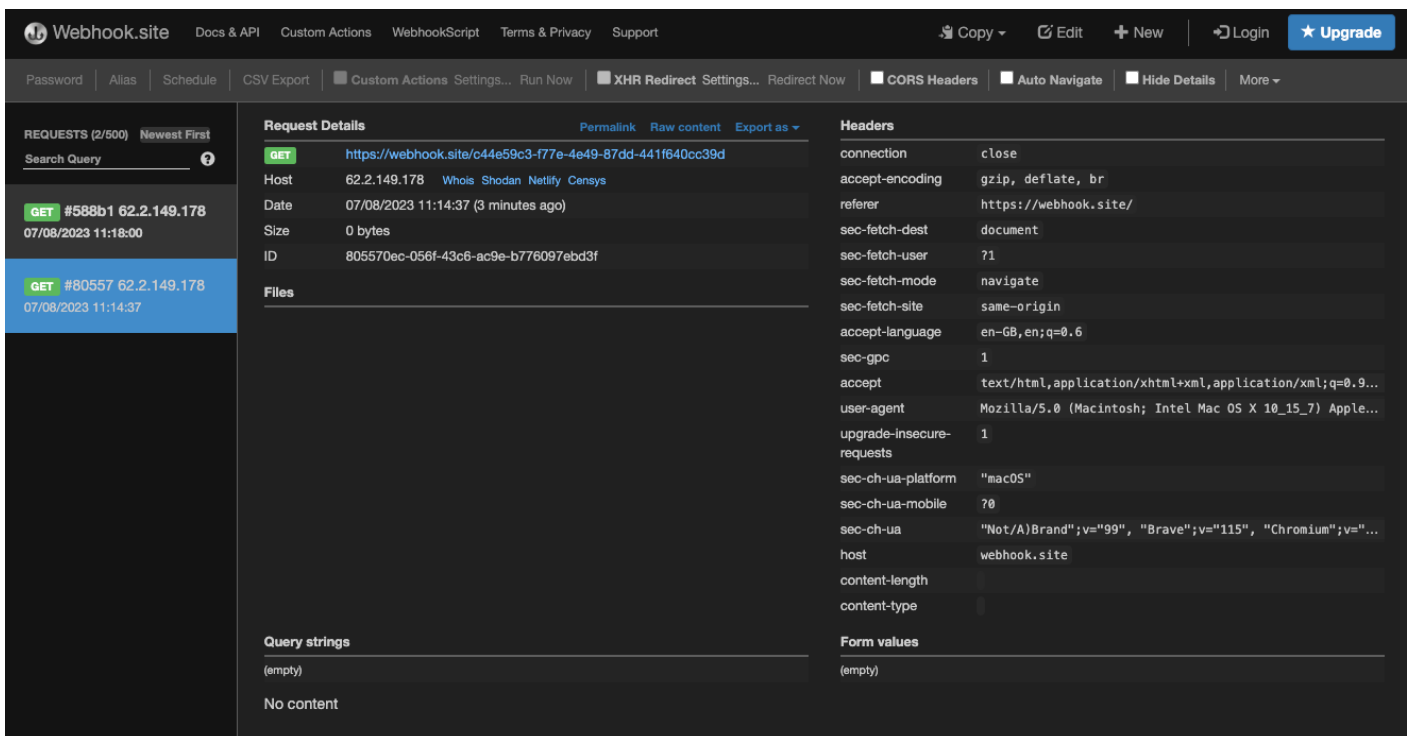

If you need to integrate for example IoT devices, you need maybe to check why the device is not able to connect to the server processing your location data or other data from a LoRaWAN Tracker or any other IoT device.

For this there's a very good service to see what kind of requests the IoT device or a middleware is making during an uplink of the data.

First the Selfhosted tools:

webhook.site

With Webhook.site, you instantly get a unique, random URL that you can use to test and debug Webhooks and HTTP requests, as well as to create your own workflows using the Custom Actions graphical editor or WebhookScript, a simple scripting language, to transform, validate and process HTTP requests.

The screenshot displays the Webhook.site web application. The top navigation bar includes links for Docs & API, Custom Actions, WebhookScript, Terms & Privacy, and Support. On the right, there are buttons for Copy, Edit, New, Login, and Upgrade. Below the navigation bar, a secondary bar contains various settings and actions like Password, Alias, Schedule, CSV Export, Custom Actions Settings..., Run Now, XHR Redirect Settings..., Redirect Now, CORS Headers, Auto Navigate, Hide Details, and More.

The main interface is divided into three sections:

- REQUESTS (2/500):** A list of incoming requests. The first request is a GET to `https://webhook.site/c44e59c3-f77e-4e49-87dd-441f640cc39d` from host `62.2.149.178` at 07/08/2023 11:18:00. The second request is a GET to `https://webhook.site/805570ec-056f-43c6-ac9e-b776097ebd3f` from host `62.2.149.178` at 07/08/2023 11:14:37.
- Request Details:** A detailed view of the selected request. It shows the method (GET), URL, host, date, size, and ID. Below this, there are sections for Headers, Files, Query strings, and Form values.
- Headers:** A list of request headers including connection, accept-encoding, referer, sec-fetch-dest, sec-fetch-user, sec-fetch-mode, sec-fetch-site, accept-language, sec-gpc, accept, user-agent, upgrade-insecure-requests, sec-ch-ua-platform, sec-ch-ua-mobile, sec-ch-ua, host, content-length, content-type, and form values.

Request Baskets

Request Baskets is a web service to collect arbitrary HTTP requests and inspect them via RESTful API or simple web UI.

Request Baskets

Basket: demo

Requests: 3 (3)

[DELETE]

⌚ 4:09:56 PM
📅 8/15/2016

/demo/123

Headers

[POST]

⌚ 4:09:23 PM
📅 8/15/2016

/demo

Headers

Body

```
{
  "id": 45902,
  "type": "image",
  "size": {
    "x": 1200,
    "y": 800
  }
}
```

[GET]

⌚ 4:07:51 PM
📅 8/15/2016

/demo?name=Peter+Pan&value=923831

Headers

Query Params

There's also a docker image here: <https://hub.docker.com/r/darklynx/request-baskets>

Beeceptor

With beeceptor you Build mock APIs in a few seconds, Inspect & Intercept HTTP requests.

With the free plan you can create 50 requests/day, see the pricing here:

<https://beeceptor.com/pricing>

Very interesting is the inspection of HTTP request, check it out: <https://beeceptor.com/docs/inspect-http-request-payloads/>

#endpoint.free.beeceptor.com 2

Rules enabled

<https://endpoint.free.beeceptor.com> → {nowhere}

⚙ Mocking Rules (15)

☰ Proxy Setup

Looks Awesome!

The following endpoint is all set up. Use it in your code as base URL and send a request. You can inspect these requests here and build rules to mock responses.

<https://endpoint.free.beeceptor.com>

For example, run the following command in shell/terminal to get started.

```
curl -v -X POST 'https://endpoint.free.beeceptor.com/my/api/path' -H 'Content-Type: application/json' -d '{"data": "Hello Beeceptor"}'
```

(or [click here](#) to simulate in web-browser)

PostBin

Programmatically Test your API Clients or Webhooks.

<https://postb.in/>

RequestBin

Inspect webhooks and HTTP requests.

Get a URL to collect HTTP or webhook requests and inspect them in a human-friendly way. Optionally connect APIs, run code and return a custom response on each request.
