Threat Prevention API

Threat Prevention APIs

Take control of the Threat Prevention APIs powered by the largest Threat Cloud in the industry

> **URL Reputation** – for a domain/URL returns the classification and risk in accessing the resource
> **File Reputation** – for a file digest (md5/sha1/sha256/sha512) returns the risk in downloading the file without the need to scan it
> **IP Reputation** - for an IP address returns it's classification and risk in accessing a resource hosted on it
> **Mail Security** – upload an email for scanning against malware and phishing attacks, based on award winning Sandblast engines

All APIs are RESTful, simple to use and can be integrated as part of a SOAR application, home-made application and more!

Detailed API instructions including samples in Java/Python can now be found in the GitHub repository.
